

# MAXIMIZING SYNOPSYS® PRIMESIM™ SPICE PERFORMANCE WITH AMD EPYC™ 7XF3 PROCESSORS

## NEXT-GENERATION DESIGN VERIFICATION

The 3rd Gen AMD EPYC™ 75F3, 74F3, AND 73F3 processors demonstrate superior performance compared to 2nd Gen AMD EPYC 7F72 and 7F52 processors running Synopsys® PrimeSim™ SPICE Suite.

January 2022

### AMD EPYC™ PROCESSORS

Designed with leading-edge 7nm technology, 2nd and 3rd Gen AMD EPYC™ SoCs offer a consistent set of features across a range of choices from 8 to 64 cores, including 128 lanes of PCIe® Gen 4 and 8 memory channels with access to up to 4TB of high-speed memory. The balanced set of resources found in EPYC processors means more freedom to match the right size of server configuration to each workload.

GEN	MODEL	CORES	BASE FREQ (GHZ)	BOOST FREQ (GHZ) <sup>1</sup>	L3 CACHE (MB)
2nd	7F52	16	3.5 GHz	~3.9 GHz	256
2nd	7F72	24	3.2 GHz	~3.7 GHz	192
3rd	73F3	16	3.5 GHz	~4.0 GHz	256
3rd	74F3	24	3.2 GHz	~4.0 GHz	256
3rd	75F3	32	2.95 GHz	~4.0 GHz	256

Table 1: Sample 2nd Gen and 3rd Gen AMD EPYC™ processor configurations used in these tests

AMD has released three generations of EPYC processors (7xx1, 7xx2, and 7xx3). Both AMD EPYC 2nd Gen 7Fx2 and 3rd Gen 7xF3 processors bring high per-core performance optimized for frequency sensitive and single threaded workloads. The rich portfolio of EPYC high-core-density products can vastly boost the run time performance of applications in the modern data center.

#### STANDARDS BASED

AMD is committed to industry standards, offering you a choice in x86 architecture. x86 compatibility means you can run x86 based applications on any AMD EPYC processor generation.

#### “ZEN 3” CORE & SECURITY FEATURES

- Support for up to:
- 64 physical cores, 128 threads
  - 256MB of L3 cache per CPU
  - 32 MB of L3 cache per core
  - 4 TB of DDR4-3200 memory
  - 128-160 PCIe® Gen 4 lanes
- Infinity Guard security features<sup>2</sup>
- Secure Boot
  - Encrypted memory with SME

#### SYNOPSYS®

Synopsys® is at the heart of innovation, such as autonomous vehicles, AI, the cloud, and 5G communications that are ushering in the era of Smart Everything. Synopsys offers advanced technologies for chip design and verification, IP integration, and software security and quality testing. They help their customers innovate from silicon to software so they can deliver Smart Everything.

#### SYNOPSYS PRIMESIM™ SPICE

Synopsys® PrimeSim™ SPICE is the next generation SPICE engine from Synopsys featuring advanced architectures and data models, new circuit partitioning, accurate load models, and new solvers to deliver breakthrough performance for large post-layout analog, RF, SerDes, DRAM, and Flash designs.

## SYNOPSYS® PRIMESIM™ SPICE

Synopsys® PrimeSim™ SPICE<sup>3</sup> is a high-performance SPICE circuit simulator for analog, RF, and mixed-signal applications. PrimeSim SPICE offers a unique multi-core/multi-machine scaling and heterogeneous compute acceleration on GPU/CPU delivering faster runtime with sign-off accuracy. PrimeSim SPICE supports High-frequency noise analysis, efficient S-Parameter handling while offering advanced analysis capabilities for periodic and non-periodic time-domain and frequency-domain applications. PrimeSim SPICE is fully integrated with PrimeWave Design Environment, a newly architected design environment and waveform viewer that encapsulates analysis and display requirements that significantly improve productivity. PrimeSim SPICE is a key engine inside PrimeSim Reliability analysis, a set of comprehensive solutions (Fault simulation, Static Circuit Check, MOS Aging, IR/EM, Variation) that analyze the full spectrum of a product life cycle, from early-life to end-of-life.

### BENEFITS

- Industry-leading multi-core and multi-machine scaling and heterogeneous compute acceleration on GPU/CPU
- RF frequency domain and envelop analysis based on Shooting Newton and Harmonic Balance algorithms
- Capacity to handle large designs with hundreds of S-parameter ports for signal integrity applications
- Integrated safe operating area and other electrical rule checks
- Built on the golden HSPICE device model library, guaranteeing device model correlation between all PrimeSim engines
- Cloud-ready, built-in support containers for running the tool in a container as well as Synopsys cloud environment

### BENCHMARKING METHODOLOGY

AMD engineering created a synthetic benchmark called *Performance* to compare the relative performance of different processors and systems. Performance is the ratio of the average application run time on the reference system (*ref*) to the average application run time on the system under test (*sut*), or  $ref/sut$ . For the purposes of this paper, reference application performance will always be normalized to 1.00, because if  $ref=sut$ , then  $ref/sut=1.00$ . Ratios greater than 1.00 ( $sut>ref$ ) mean that the system under test performs higher than the reference system, with  $ref>sut$  indicating the test system underperforming the reference.

The tests described in this brief compared the relative performance of systems powered by different pairs of AMD EPYC processors. Each test used the slower system as the reference system for that test.

The tests described in this brief compared the relative performance of systems powered by different pairs of AMD EPYC processors. Each test used the slower system as the reference system for that test.

AMD used eight processor cores to run each copy of the full Synopsys PrimeSim application. Thus, *total processor cores/8* simultaneous copies of the full application used all of the processor cores. For example, a system with a 32-core AMD EPYC 75F3 ran four simultaneous copies of the application because  $32 \text{ CPU cores} / 8 \text{ cores per copy} = 4 \text{ copies}$ . These tests captured the elapsed application run time (in seconds) three times for each benchmark on each running copy. These three run times were then summed and divided by three to obtain the average run time for each application copy. Finally, these averages were summed and then divided by the number of running application copies, as follow (2 on a 16-core system, 3 on a 24-core system, and 4 on a 32-core system) to yield the average application performance on a fully-loaded system.<sup>4</sup>

Table 1 and Figures 1, 2, and 3 show the data for these results and calculations with the corresponding average application performance on a fully-loaded system.

## COMPARISON ANALYSIS

First, AMD compared the performance of the 2nd Gen EPYC 7F52 and 3rd Gen EPYC 73F3 16-core, high frequency processors. Figure 1 shows that the performance increased generation on generation as a direct result of the improved frequency, IPC, and larger 32MB L3 cache available to a single core on the 73F3 compared to the 7F52.<sup>5</sup>

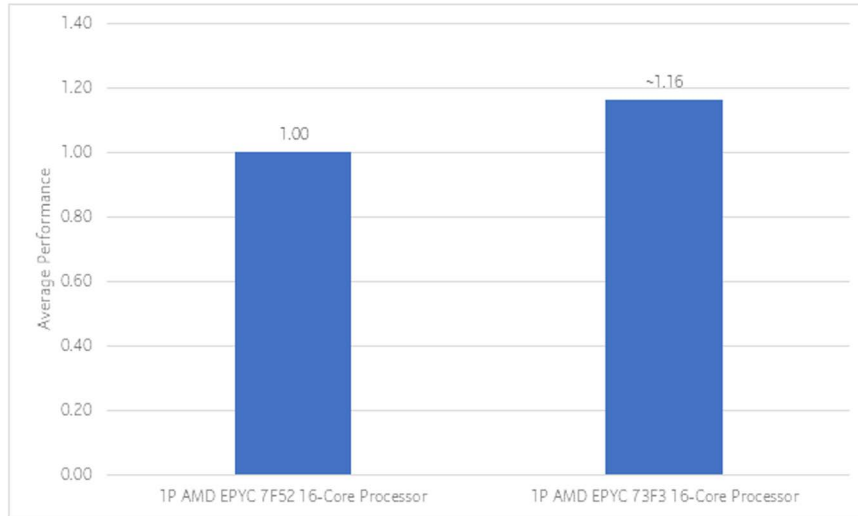

Figure 1: 1P AMD EPYC 7F52 (reference) and 1P AMD EPYC 73F3 16c average performance comparison

Next, AMD examined the performance of the 2nd Gen AMD EPYC 7F72 3rd Gen AMD EPYC 74F3 24-core high frequency processors. Again, there is improvement in performance beyond the already excellent EPYC 7F72 results.

Figure 2: 2P AMD EPYC 73F3 16c and 1P AMD EPYC 75F3 32c average performance comparison

Lastly, AMD explored the workload in terms of socket configuration. AMD has found that some applications prefer the closer topology of a single socket, while others prefer the additional bandwidth offered by a two-socket solution. The following chart compares the performance of this workload on two third-generation platforms with the same total number of cores, one using a 2P configuration and the other a 1P configuration. In this case, PrimeSim SPICE is one of those applications that is expected to respond well to the additional bandwidth provided by a two-socket solution, as evident in the average performance data based on FineSim SPICE.

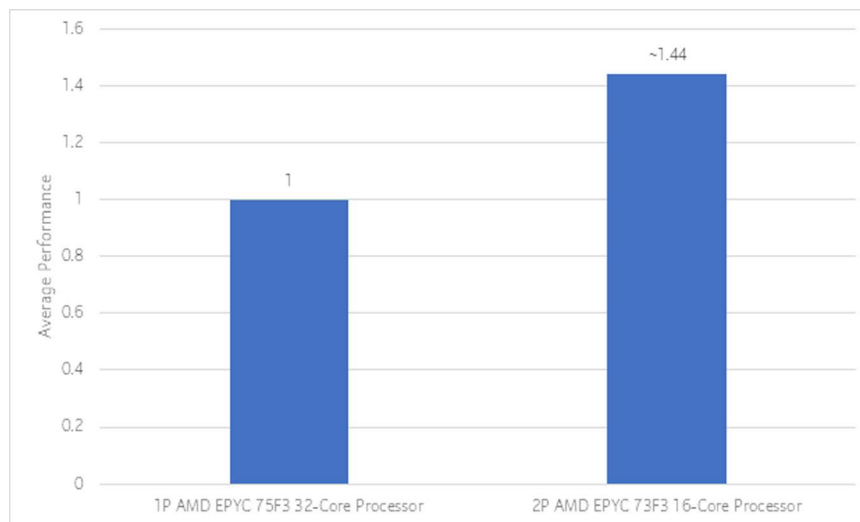

Figure 3: 2P AMD EPYC 73F3 16c and 1P AMD EPYC 75F3 32c average performance comparison

## AVERAGE ELAPSED RUNTIME FOR AMD EPYC 2ND GEN AND 3RD GEN PROCESSORS

AVERAGE ELAPSED RUNTIME	1P AMD EPYC 7F52 16-CORE PROCESSOR	1P AMD EPYC 73F3 16-CORE PROCESSOR	1P AMD EPYC 7F72 24-CORE PROCESSOR	1P AMD EPYC 74F3 24-CORE PROCESSOR	2P AMD EPYC 73F3 16-CORE PROCESSOR	1P AMD EPYC 75F3 32-CORE PROCESSOR
<b>Analog Simulation</b>	18,703.2	16,081.5	22,072.7	19,519.3	16,136.0	23,283.5

Table 2: Average elapsed runtime for 2nd Gen and 3rd Gen AMD EPYC processors, in seconds, on a fully-loaded system

## CONCLUSION

AMD 3rd Gen EPYC 7x F3 processors show exceptional per-core and per-node performance across all load levels with compelling single-socket and dual-socket solutions. In addition, the 32-core AMD EPYC 75F3 extends the product range and unlocks even higher total performance and compute density. Together, these capabilities make the AMD EPYC 7x F3 family of processors an excellent choice for running Synopsys PrimeSim SPICE.

## ACKNOWLEDGEMENTS

- Philip Steinke is a Fellow in CAD/Methodology focused on EDA workloads on EPYC and executing EDA flows in the Cloud.
- Sylvester Rajasekaran is a PMTS S & A Engineer for AMD.
- Brian Malley is a Senior Silicon Design Engineer for AMD.
